Abstract

The Shingle Lay is a tool for aligning a row of shingles. It aligns and holds the shingles while workers are fastening them to the surface that is to be covered. The long straight edge allows many shingles to be laid and held in place. The 1/8" slot at the front rib of the tool receives a 1/8" cable that supports the tool. The cable has beads at 5" intervals to space each row of shingles evenly. The cable is attached to the peak of the roof or the surface that is to be covered.
